

Quick-Win Industry Templates

Reusable starter prompts for marketing, business analysis, and content creation.

What this is useful for

Speeding up common business prompting tasks.
Creating reusable templates for teams.
Reducing blank-page prompt writing.

The key idea

Templates make repeatable work faster while preserving the core prompt ingredients: role, context, task, audience, message, output structure, and constraints.

Reusable industry templates

For Marketing: You are a [specific marketing role] with expertise in [industry/channel]. I need [specific content type] for [product/campaign] targeting [audience]. Our key message is [value proposition]. The content should [specific goals] and include [required elements]. Format it as [structure details] with a [tone] tone.

For Business Analysis: You are a [type of analyst] specialising in [industry/methodology]. I need an analysis on [topic/problem] within [context/timeframe]. The key factors to consider are [variables/constraints]. Present your analysis as [format] with [specific sections]. Include [data points/metrics] and recommendations for [goal].

For Content Creation: You are a [type of content creator] who excels at [style/format]. Create a [content type] about [topic] for [audience]. The content should convey [key message/emotion] and include [elements]. Format it as [structure] with [tone] tone. Optimise it for [platform/medium] and include [technical requirements].

How to use it

Choose the template closest to the job.
Replace every bracketed variable with specific information.
Add constraints that match the business situation.
Save the filled prompt as a reusable version if it works well.

Example

Marketing prompt example: “You are a B2B content strategist with expertise in LinkedIn lead generation. I need a short carousel outline for an AI automation audit targeting operations managers. Our key message is reducing manual admin without replacing the team. Format it as seven slide titles with one supporting bullet each, using a practical, plain-English tone.”

Common mistakes

Leaving bracketed variables vague or partly filled.
Using the same template for tasks with different risks or review needs.
Using a vague task instead of a clear job.
Leaving out business context, constraints, or success criteria.
Asking for an answer without defining the required output format.
Treating AI output as final without review, testing, or correction.

Quick checklist

- ☐ Every variable is filled
- ☐ The audience is explicit
- ☐ The output structure is clear
- ☐ The prompt can be saved and reused
